## Regular Languages

The class of regular languages can be:

- 1 Recognized by NFAs. (equiv. GNFA or  $\epsilon$ -NFA or NFA or DFA).
- 2 Described using **Regular Expressions**.

Today:

- 1 See the limit of regular languages.
- 2 How to show a language is not regular.

# Types of proofs

We show a language is regular using “**proof by existence**”:

- Construct an NFA recognizing it.
- Write a Regular Expression for it.  
Using closure under the **union**, **concatenation** and **star** operations.

We show a language is regular using “**proof by existence**”:

- Construct an NFA recognizing it.
- Write a Regular Expression for it.  
Using closure under the **union**, **concatenation** and **star** operations.

However, if a languages is *not regular* then how can we show that?!

# Is it raining now? – example of proof by contradiction

 $(111)^0 = \varepsilon, (111)^1 = 1^3,$   
 $(111)^2 = 1^6, (111)^3 = 1^9, \dots$
- **11111** can be pumped to give:  
 $(11111)^0 = \varepsilon, (11111)^1 = 1^5,$   
 $(11111)^2 = 1^{10}, (11111)^3 = 1^{15}, \dots$
- The shortest string that can be **pumped** is: **111**.
- **3**, the length of **111**, is called: **pumping length**.

# Unary alphabet

Let  $L$  be a regular language over a unary alphabet  $\Sigma = \{1\}$ .

The language  $L$  is:

- either **finite**, in which case it is regular trivially,
- or **infinite**, in which case its DFA will have to **loop**:
  - The DFA that recognizes  $L$  has a finite number of states.
  - Any string in  $L$  determines a path through the DFA.
  - So any sufficiently long string must visit a state twice.
  - This forms a loop.

This looped part can be repeated any arbitrary number of times to produce other strings in  $L$ .

# A property satisfied by all RLs

Finite number of states  $\rightarrow$  DFA repeats one or more states if the string is long.

- When a DFA repeats a state  $R$ , divide the string into 3 parts:

- 1 The substring  $x$  before the first occurrence of  $R$
- 2 The substring  $y$  between the first and last occurrence of  $R$
- 3 The substring  $z$  after the last occurrence of  $R$

- $x, z$  can be  $\epsilon$  **but**  $y$  cannot be  $\epsilon$ . ( $y$  forms a genuine loop.)
- Then, if the DFA accepts  $xyz$  then it accepts all of:

$xz, xy^2z, xy^3z, \dots$

For any RL  $L$ , it is possible to divide an **accepted string**, that is “long enough”, into 3 substrings  $xyz$ , in such a way that  $xy^*z$  is a subset of  $L$ .

# The Pumping Lemma (PL)

- We will denote a **pumping length** by  $p$ .
- The precise meaning of “long enough” will be:  $|w| \geq p$ .
- $y$  has to be in the first  $p$  symbols of  $w$ .

Implications

Constant Space

## Example ( $L = \{a^n b^n \mid n \geq 0\}$ )

① **Prover** claims  $L$  is regular and fixes a pumping length  $p$ .

③ **Prover** tries to split  $w = a \dots ab \dots b$  into  $xyz$  such that  $|xy| \leq p$

$\underbrace{a \dots}_{x} \underbrace{\dots}_{y} \dots \underbrace{ab \dots b}_{z}$

Since  $y$  must be within the first  $p$  symbols then  $y$  is made of  $a$ 's only.

② **Falsifier** challenges **Prover** and picks  $w = a^p b^p \in L$ . ( $|w| = 2p \geq p$ )

$w = \underbrace{a \dots a}_{p \text{ symbols}} \underbrace{b \dots b}_{p \text{ symbols}}$

## Example ( $L = \{a^n b^n \mid n \geq 0\}$ )

① **Prover** claims  $L$  is regular and fixes a pumping length  $p$ .

③ **Prover** tries to split  $w = a \dots ab \dots b$  into  $xyz$  such that  $|xy| \leq p$

$$\underbrace{a \dots}_{x} \underbrace{\dots}_{y} \dots \underbrace{ab \dots b}_{z}$$

Since  $y$  must be within the first  $p$  symbols then  $y$  is made of  $a$ 's only.

② **Falsifier** challenges **Prover** and picks  $w = a^p b^p \in L$ . ( $|w| = 2p \geq p$ )

$$w = \underbrace{a \dots a}_{p \text{ symbols}} \underbrace{b \dots b}_{p \text{ symbols}}$$

④ **Falsifier** now can for example build

$$xy^2z = xyyz = \underbrace{a \dots a}_{\text{more than } p \text{ symbols}} \underbrace{b \dots b}_{\text{still } p \text{ symbols}}$$

Hence  $xy^2z \notin L$ , and  $L$  is not regular.

## Example ( $L = \{ww \mid w \in \{0, 1\}^*\}$ )

## Example ( $L = \{ww \mid w \in \{0, 1\}^*\}$ )

① **Prover** claims  $L$  is regular and fixes a pumping length  $p$ .

② **Falsifier** challenges **Prover** and Choose  $w = \underline{0^p 1} \underline{0^p 1} \in L$ . This has length  $|w| = (p + 1) + (p + 1) \geq p$ .

Example ( $L = \{ww \mid w \in \{0, 1\}^*\}$ )

① **Prover** claims  $L$  is regular and fixes a pumping length  $p$ .

③ **Prover** tries to split  $w = 0\dots 010\dots 01$  into  $xyz$  such that  $|xy| \leq p$

$0 \dots 010 \dots 01$   
 $\underbrace{\hspace{1.5cm}}_x \underbrace{\hspace{1.5cm}}_y \underbrace{\hspace{1.5cm}}_z$

Since  $y$  must be within the first  $p$  symbols then  $y$  is made of 0's only.

② **Falsifier** challenges **Prover** and Choose  $w = \underbrace{0^p 1}_{p \text{ symbols}} \underbrace{0^p 1}_{p \text{ symbols}} \in L$ . This has length  $|w| = (p+1) + (p+1) \geq p$ .

$w = \underbrace{0 \dots 0^p 1}_{p \text{ symbols}} \underbrace{0^p 1}_{p \text{ symbols}}$

# Food for thought

If “modern computer” = Finite Automaton then:

- We can only store a fixed finite amount of data, say

$1\text{TB} = 1024^4 \times 8 = 2^{43}$  **bits** of information, i.e. a maximum of  
 $2^{2^{43}} \approx 10^{2,647,887,844,335}$  **states** – a finite number still!

# Food for thought

This occurs when the number of  $a$ 's becomes greater than  $2^{2^{43}}$ .
- We have assumed that the input string is not stored in the computer. . . (otherwise, it would just run out of memory anyway).
- However, at 3GHz for example, this would take. . . a length of time so inconceivably huge that the age of the universe would be negligible by comparison. (So, do we care?)

# Space Complexity: Constant Space $\longleftrightarrow$ NFAs

- Finite Automaton: good model for algorithms which require **constant space** (i.e. space used does not grow with respect to the input size).
- Some languages cannot be recognized by NFAs.  
*Space used in computation must **grow** with respect to the input size.*
- We will see a more powerful model of computation next week!
